

# After-hours dispatch voice agent

A fixed-scope pilot that answers after-hours HVAC calls, qualifies urgency, captures property details, and routes true emergencies to the on-call technician without losing quote-ready demand.

**\$4,200**

Modeled monthly revenue leakage

**92**

Readiness score from intake audit

**14 days**

Pilot launch window after kickoff

**124 hrs**

Implementation budget

## Recommended path

Deploy a Sarah-style intake agent for emergency triage first, then expand into quote scheduling once the call logs prove routing accuracy and objection coverage.

- Capture caller name, property ZIP code, unit type, issue category, and emergency status.
- Escalate no-heat, active leak, electrical smell, and vulnerable-occupant calls immediately.
- Send all non-emergency leads into the CRM with a proposed callback window and transcript summary.

This sample is generated from HTML through PyMuPDF to keep page geometry, text extraction, and watermark behavior testable in the repo.

In scope

- One inbound voice agent for after-hours dispatch.
- Emergency routing rules and technician notification copy.
- CRM lead creation with transcript, summary, and priority fields.
- Five regression scenarios for emergency, routine, and ambiguous calls.

Out of scope

- Live payment collection.
- Multi-location franchise routing.
- Warranty adjudication or parts inventory lookup.
- Production SMS campaigns beyond dispatch notification.

Milestones

| Milestone         | Acceptance check                                                             | Amount  |
|-------------------|------------------------------------------------------------------------------|---------|
| Design            | Prompt, intake schema, escalation matrix, and CRM field map approved.        | \$4,62  |
| Build             | Agent, webhook, CRM write, and audit event are working in staging.           | \$6,47  |
| Test              | Regression set passes and transcript summaries match the expected schema.    | \$3,70  |
| Launch            | Production number forwards after hours and first-week monitoring is enabled. | \$3,70  |
| Fixed pilot total |                                                                              | \$18,50 |

# Why approve now

Acme already has a narrow call category, high-value missed demand, and a clear escalation owner. That makes the pilot a low-risk first automation with measurable revenue recovery.

## Business case

Recovering five additional qualified jobs per month at the modeled ticket value covers the pilot cost inside the first operating quarter.

## Operator guardrails

The agent does not diagnose equipment, promise arrival windows, or quote repairs. It captures facts, classifies urgency, and routes.

# Next steps

- Confirm CRM destination fields and emergency escalation contacts.
- Approve the four milestone payment schedule.
- Schedule a 60-minute kickoff with operations, dispatch, and the on-call lead.

Sample artifact only. Public demo data is synthetic and safe to inspect, share, and regenerate.
